Calving Management Practices for Dairy Herds

Gustavo M. Schuenemann, DVM, MS, PhD

Veterinarian and Dairy Extension Specialist
Department of Veterinary Preventive Medicine,
College of Veterinary Medicine,
The Ohio State University

(©2013 G.M. Schuenemann)
Objectives

- Recognize the imminent signs of birth and calving progress
- Provide guidelines for calving management practices to reduce the prevalence of stillbirth and metritis under field conditions
- Be able to determine when first-calf heifers or cows need assistance at calving
- Be able to record calving-related events

Please note that the information provided herein may or may not apply to all situations. Consult with your herd veterinarian for more information.
Frequency of Dystocia

(USDA. 2010. USDA:APHIS:VS, CEAH. Fort Collins, CO.)

(©2013 G.M. Schuenemann)
Maternity Pen or Area

- **Guidelines:**
  - At least 175 ft$^2$ (16 m$^2$) per cow
  - **Flooring:** sand, dirt, or clay
  - **Bedding:** straw (6-10 in deep), change frequently to keep it dry and clean
  - Well-ventilated
  - Adequate lighting
Sizing the Close-Up Pen

- **Example**: 2000-cow herd
- Determine the time period (3 wks) and size of close-up pen (# of stalls)
  - $2000/365 = \text{average 5.5 births per day}$
- How many calving per week?
  - $5.5 \text{ births/d} \times 7 \text{ d} = \sim 38 \text{ births per week}$
- How long is the close-up period?
  - $38 \text{ births} \times 3 \text{ wks} = \sim 115 \text{ births for the 3-wk close-up period}$
Sizing the Close-Up Pen

Average = 38 births per week
Range = 6-54 (or 16% - 142% of weekly average)
Guideline: to avoid overstocking, plan for 162 stalls for the close-up period based on max average (140%) births per week (54 births/wk * 3 wks = 162 stalls)

(Number of Births vs. Date Graph)

©2013 G.M. Schuenemann)
Management of Close-Up Cows

- Although “average” births per week is a valuable metric, most producers are faced with calving “ranges”

- All these calculations assume cow grouping at dry-off and “calving date” is known

- Add additional challenges for no-calving dates (bull bred first-calf heifers or cow, missing records, or unknown pregnancy status)
Parturition

- Parturition is a process initiated by a cascade of hormonal and physical changes at the end of gestation (~280 days in cattle)
- **Three stages:**
  - Stage I (dilation of birth canal)
  - Stage II (labor or calf expulsion)
  - Stage III (passing fetal membranes)
- It progresses gradually from one stage to the next!

(Noakes et al., 2001; Schuenemann et al., 2013)

(©2013 G.M. Schuenemann)
Stage I

- **Stage I** consists of the dilation of the birth canal (soft tissues and ligaments)
- **Restless behavior**: Walk, transition from laying to standing positions, kick the belly, vocalization, tail raised, urinate, ...
- **Physical changes**: Udder is full, dilation of vulvar ring, ...
- It ends with a fully dilated cervix and the appearance of the amniotic sac (AS) or “water bag” outside the vulva
Stage II begins with a fully dilated cervix, the appearance of the “water bag”, and abdominal contractions are evident.
Stage III is the expulsion of the fetal membranes, which occurs around 8-12 hours post calving. If >24 hours, it is considered retained fetal membranes (Kelton et al., 1998)
Calf Delivery

- **Presentation**: It refers to whether the calf is coming forward (anterior), backward (posterior), or transverse.

- **Position**: It refers to the calf’s position in relation to the cow.

- **Posture**: It refers to how the calf’s head and limbs are in relation with its body.

(Noakes et al., 2001; Schuenemann et al., 2013)
Normal Calf Delivery

Estimated values:
- Forward or Anterior = 96%
- Backward or Posterior = 4%
- Multiple Births = 5%
- Breech = 1%

(Hunter et al., 2013)

(©2013 G.M. Schuenemann)
Eutocic or Dystocic Births

- **Eutocic Birth**: Normal delivery of single or multiple calves
- **Dystocic Birth**: It is defined as a difficult birth resulting in prolonged calving or severe assisted extraction of the calf at birth
Early Signs of Calving

Cow with enlarged vulva & mucus plug

Cow with dilated vulva & enlarged udder

(©2013 G.M. Schuenemann)
Imminent Signs of Calving

Walking, pacing, sniffing, & tail-raised

Lying down & showing feet of the calf outside the vulva
Imminent Signs of Birth

Envelops outside the vulva & tail-raised

Showing feet/nose of the calf outside the vulva

(©2013 G.M. Schuenemann)
The rear legs of the calf are still in the vulva of the cow, but birth is completed.

Cow recovers from labor, stand-up, & lick the calf.

Guidelines for Obstetrics

- Visual guide of calving management
- Calving supplies
- Abnormal postures or presentations
- Calving injuries
- ...

(©2013 G.M. Schuenemann)
Hygiene Practices

- Use clean, disposable, long sleeve gloves
- Wash the perineum with clean water and soap-disinfectant, repeat if cow defecates!
- Sanitize obstetric chains before and after each intervention or use

(©2013 G.M. Schuenemann)
Most Transition Diseases are Associated with Excessive Negative Nutrient/Calcium Balance and Body Tissue Mobilization Prior to- or after Calving
Assessing hygiene score at calving: Picture shows an score 1
(Adapted from Schreiner and Ruegg 2003; JDS 86:3460–3465)

Score 1:
- Perineum region is free of dirt/manure (<2% of surface area)
- Complete dry

Score 2:
- Manure/dirt is visible around the perineum region
- <10% of surface area

Score 3:
- Perineum region is moderately covered with dirt/manure
- >11-30% of surface area (or greater)

(©2013 G.M. Schuenemann)
Effect of Hygiene Scores on Metritis

Score 3
(n=84)

(Schuenemann et al., 2011b; JDS 94:744)

(©2013 G.M. Schuenemann)
When Should I Call for Help?

- Establish guidelines in your SOP
- Normal progression occurs every 15-20 minutes
- If no progress within 1 hour after the appearance of the water bag, intervention is required!
- When abnormal posture is evident (e.g., appearance of one foot outside the vulva) immediately after “water bag” appearance, or for uterine torsions (where the water bag or feet do not appear outside the vulva), obstetric intervention is rendered
- If there is no progress within 30 minutes of intervention, call for help!

(©2013 G.M. Schuenemann)
Calving-Related Injury

Vulvar or Perineal Laceration

(©2013 G.M. Schuenemann)
Assist the Newborn

- Make sure the calf is breathing
- Check cow for any additional calf (twins)
- Feed colostrum to the calf within 3 hours of birth
- When the cow is able to stand and walk, move her to the fresh pen

Cow sniffing the newborn calf immediately after birth

(©2013 G.M. Schuenemann)
- Remove placenta from the maternity pen
- For assisted births, wash and sanitize obstetric chains and bucket before and after each use
- See link to CFSPH below for selected disinfectants

Serum Ca$^{2+}$ within 48 h after Calving

Fig. 1. Serum calcium concentrations were plotted for 1462 cows. All serum samples were collected within 48 h postpartum by lactation number: 1st lactation cows ($n = 454$), 2nd lactation cows ($n = 447$), 3rd lactation cows ($n = 291$), 4th lactation cows ($n = 166$), 5th lactation cows ($n = 72$), and 6th lactation cows ($n = 32$). The percent of cows by lactation number that experienced a clinical milk fever episode which was treated or were subclinically hypocalcemic are shown in the graph.

(Adapted from Reinhardt et al., 2011; Veterinary J. 188:122–124)
Prevention of Stillbirth

- At national level:
  - Selection program for sires with calving ease genetics

- At herd level:
  - Training of calving personnel & establish SOPs
  - Facilities & prevent hypocalcemia prepartum
  - Close monitoring of first-calf heifers
  - Calves born in backward presentations
  - Communication at the time of shift change of personnel
  - Length of time in dry pen
  - Use of sires with calving ease genetics
  - ...

(©2013 G.M. Schuenemann)
Effect of Calving Training to Dairy Personnel on Stillbirth?

(Schuenemann et al., 2013)

(*P < 0.05)
Additional Considerations

- Early intervention has the potential to prevent stillbirth, but also has the potential for dam injury due to lack of soft tissue dilation
- For backward presentations, help finish birth!
- For first-calf heifers, once the nose/feet of the calf are outside the vulva, help finish the birth!
- Calving protocols/data should be reviewed and adjusted (if necessary) at least twice a year
- Make sure your calving personnel know what to look for/monitor before and during calving and why it is important
Personnel Feedback on Calving Management Practices

Dairy calving management: Description and assessment of a training program for dairy personnel

G. M. Schuenemann, S. Bas, E. Gordon, and J. D. Workman
Department of Veterinary Preventive Medicine, The Ohio State University, Columbus 43210

ABSTRACT

- Importance of open communication within the farm team (e.g., between workers at the time of work shift and when to call for help)
- Need for new or additional obstetric chains to assist difficult births
- Need for additional help to be able to assist severe or multiple cows experiencing dystocia at the same time
- Importance of having established and written calving protocols (e.g., hygiene practices, what to look for, why it is important, and when it is appropriate to intervene)
- Animals with unknown anticipated calving dates (e.g., missing records or bull bred first-calf heifers)
- Use of defined events for record-keeping (e.g., scale used for ease of calving, stillbirth, retained fetal membranes)
- Proper maintenance of calving or maternity pen (e.g., broken water hose or gate)
